

Chapter 3

Field Artillery Weapon Systems

3-1. Introduction

a. This chapter provides gunnery training programs for units equipped with 105-mm howitzers, 155-mm howitzers, the Multiple Launch Rocket System (MLRS), and the Bradley Fire Support Vehicle (BFSV). Each program is composed of a standard for qualification, a suggested training strategy to achieve the standard and the ammunition required to execute the strategy. The qualification standards for the field artillery are stated in paragraph 3-4, below. The suggested training strategy and ammunition quantities are contained in the tables at the end of this chapter. Events in the strategy are from the artillery tables (ATs) of the cannon and MLRS mission training plans (MTPs). Table 3-1 is an index of gunnery training programs for FA weapon systems and other weapons and pyrotechnics pertinent to FA units.

b. The objective of the weapons training programs is to provide the unit commander models for attaining and sustaining weapon proficiency throughout the training year. Proficiency is achieved through the use of dry-fire exercises; training aids, devices, simulators and simulations (TADSS); and live-fire exercises.

3-2. Strategies

a. The combined arms training strategy (CATS) is the overarching strategy for the management and planning of unit training. It provides a system which places scarce training resources at the right times and places to provide trained soldiers and units that can accomplish required tasks across the scope of military operations. The unit strategies of CATS describe the frequency of specific events, by echelon, recommended for maintaining warfighting proficiency and readiness.

b. Commanders use the CATS training events to train their personnel and units to perform the unit's mission essential tasks list (METL) to standard. Use of TADSS is an integral part of this strategy. Major resource components of the CATS are operating tempo (OPTEMPO), training ammunition, ranges and training areas, combat training centers (CTCs), reserve component-(RC-) unique needs, simulators, and the family of simulations (FAMSIM).

c. The CATS is multi-echelon training that involves the simultaneous training of more than one echelon on different tasks to raise units to an acceptable level of readiness. For example, during a battalion field training exercise (FTX) the headquarters battery would be engaged in training of tasks that, while different from those of the firing batteries, support the firing battery and battalion training. Likewise, in both the headquarters and firing batteries, each platoon and section is training on different tasks while supporting the overall effort. Multi-echelon training contributes to overall team building.

d. Units use the crawl, walk, run method by following the ATs from the appropriate MTP. A battery will train AT XIII, (Battery Training) expending the minimum amount of resources and, perhaps, even going through some tasks step-by-step while discussing how it should be done.

When the commander feels the unit can operate at normal speed, the unit will move on to AT XIV, (Battery Certification) and use primers or shot gun shells and some added realism to increase the unit effort to perform properly. Finally the unit will conduct live-fire full-simulated combat operations in qualifying during the performance of table XV, (Battery Qualification). In this process, the performance of tasks at the lower level to standard is the "gate" that allows the unit to progress to the training of the next higher level. The crawl, walk, run methodology saves resources and provides for repetitive training to master all required tasks.

e. The FA CATS is found in chapter 3 of the appropriate ARTEP-MTP manual. CATS are posted to the Reimer Data Repository and may be downloaded by using the Standard Army Training System (SATS). CATS events can then be selected by using the point and click function of SATS 4.2. The training planner can modify the event to meet the specific unit training objective and/or prevailing conditions and circumstances.

f. The training strategies in this chapter are based on exercises in the CATS, field manuals (FMs), ATs, and ARTEP-MTPs. These references must be used in conjunction with this publication to plan and execute an effective unit training program.

3-3. Training Aids, Devices, Simulations and Simulators (TADSS)

a. *General.* Rising ammunition cost and concern for environmental conditions have resulted in increasing dependence on TADSS. There are three categories of TADSS, live, virtual and constructive. When used together, they have a synergistic effect on a unit's training. A balanced use of these training support capabilities will enable all commanders and trainers to provide a "trained and ready force" to meet our Army's needs.

b. Constructive simulations are usually identified with the large-scale, complex computer-driven models associated with exercises dealing with battalions, brigades, divisions, corps, and echelons above corps. The primary training audience of constructive simulations is the commander, subordinate commanders and their associated battle staffs.

c. Virtual simulations are designed to train individual soldiers and small crews in collective training tasks. Virtual simulations are often associated with crew-served weapons systems and focus on training devoted to emphasize familiarity, skill development, and practice. These simulations include simulators that closely replicate all or parts of tanks, armored personnel carriers, aircraft, and other equipment and normally require the trainee(s) to immerse into the simulation. The trainee then inputs the applicable information into the controls of the simulator while visual, sound, and motion playback is provided to cause the trainee to continue to interact with the simulator through a prescribed number of tasks.

d. Live simulations are training events in which all trainees physically deploy [usually against an opposing force (OPFOR)] and use weapons simulators to replicate certain parts of combat. Live simulations can take place almost anywhere the maneuver space is available, but the most notable are the exercises at the National Training Center (NTC), the Joint Readiness Training Center (JRTC), and the Combat Maneuver Training Center (CMTC). In each of these combat training centers (CTCs), troops conduct tactical operations as units and use various simulators in

the course of training. Examples of these simulators are MILES and SAWE-RF, which replicate weapons systems interaction and damage resulting when these simulators are employed.

e. Effective use of the “synthetic” training environments, constructive and virtual, can help offset the costly aspects of the live environment, such as OPTEMPO, training ammunition, live-fire ranges and CTC deployments. Training devices aid sustainment training in garrison or local training areas. Devices enhance and sustain skills and may be the sole medium for training certain critical tasks.

f. Each weapons training program contains a STRAC XXI chart which shows possible ways to integrate TADSS into the process.

3-4. Qualification standards.

a. Cannon. As part of a platoon or larger unit, each section must live-fire 80 percent of its METL-related fire missions to ARTEP-MTP standards twice annually for active component (AC) (TRC A) units and once annually for Army National Guard (ARNG) (TRC B/C) units. United States Army Reserve (USAR) training battalions (TRC D) will train those events listed in Tables 3-20 and 3-21.

b. Multiple Launch Rocket System. As part of a platoon or larger unit, the launcher section must live fire 80 percent of its METL- related fire mission tasks to ARTEP-MTP standards twice annually for AC (TRC A) units and once annually for ARNG (TRC B/C) units.

c. Bradley Fire Support Vehicle. Fifty percent of vehicle crews will qualify on Bradley Table VIIA/B annually. Crews will conduct training in accordance with table 3-22.

3-5. Resources

a. General. It is not possible to provide ammunition to train all FA fire missions. Tables 3-3 and 3-9 show the MTP fire mission candidates for training for 105-mm and 155-mm units, respectively. Commanders must choose which of these fire missions are to be included in the unit's METL. Table 3-29 provides the same information to commanders of MLRS units. The training strategy model may be altered to suit normal mission requirements, but ammunition quantities may not be exceeded without approval of the major command (MACOM). In the rare instance in which a unit is faced with a truly *unique* requirement, a request for additional ammunition may be submitted through channels to the parent MACOM.

b. Special Munitions. The cannon training programs include a separate entry, AT XV Special Missions, for smoke, white phosphorus (WP), and illumination (illum) missions.

c. Rocket Assisted Projectile (RAP). A discretionary authorization of two rocket assisted projectile (RAP) rounds per tube annually is available to cannon units. Commanders must take a hard look at the value of live-fire training with this projectile, since four high explosive (HE) rounds must be traded for each RAP round.

d. *Copperhead (CPHD)*. An authorization for two Copperhead per AC and one per ARNG unit is available. No trade-off is required for these rounds.

e. *Close Support (CS)*. CS tasks are included in the 105-mm howitzer battalion table 3-3. These tasks satisfy the mission to provide close-in fires in support of light infantry units.

f. *Division Readiness Brigade (DRB)*. DRB is a mission assigned to airborne units by the Department of Defense. Table 3-6 provides ammunition for DRB designated 105-mm battalions in addition to that authorized in Table 3-5. A DRB designated separate 105-mm battery is authorized one-third of the ammunition in Table 3-6 in addition to that authorized in Table 3-4
